

Assignment 4

March 18, 2020

Overview

We have to make a lambda spreadsheet which supports some basic functionalities.

Specifications

1. Use make first for making the "parse" executable
2. Use the following command format

"./parse" <data file> "<" <input file> (command written in quotes should be written as it is and without quotes and then just replace the data file with a csv file and input file with the input file)
3. The code is written to handle multiple commands. But the sheets renew after each command.
4. NO changes from the code in the previous assignment apart from adding functions.
